

### Exercise 1

Create a simple C++ program that will display two messages. The first message is displayed from your main() function. Second message is displayed from a function named displayMessage();

### Exercise 2

Create a C++ program that will calculate gross salary. In order to complete this task:

1. Create four **global variables** named: gross, salary, bonus, allowances
2. Create these three functions: enterInputs(), calculateSalary(), displaySalary().

Function	Task
enterInputs()	User will insert three values which are: <ol style="list-style-type: none"><li>1. Salary</li><li>2. Bonus</li><li>3. Allowances</li></ol>
calculateSalary()	Create a Mathematical formula to calculate gross salary based on three values entered by user
displaySalary()	Display a message below:  Gross Salary: RM5100

### Exercise 3

Create a C++ program that will display selected major entered by user. First, create a return function name getMajor(). Display these majoring options to user:

- 1 – Computer Science
- 2 - Electrical Engineering
- 3 – Accounting
- 4 – Wood Technology
- 5 – Business Administration and Management

User will enter any code given. Next, display the selected major code as shown below:

**You have select 1**
